Cody McLane and the Lab37 hiring team
Lab37 Robotics
Warrendale, Pennsylvania

**BOWL BUILDER IS NOT SIMPLY A ROBOT. IT IS A CONTROLLED
FOOD-PRODUCTION SYSTEM FOR TURNING ORDER INTENT INTO
FOOD THAT IS ACCURATE, SAFE TO OPERATE, TRACEABLE,
RECOVERABLE, AND ECONOMICALLY REPEATABLE.**

That is why the Robotics Product Manager opportunity feels so aligned with the work I enjoy most. The product must reconcile mechanical design, software truth, ingredient behavior, food controls, telemetry, operator workflow, manufacturing, support, customer experience, and unit economics in the real world. My career has repeatedly placed me at those intersections, translating field reality into product and operating decisions.

At Vape-Jet, I lead product-facing operating work in a software-enabled robotics and machine-vision environment with approximately 1,000 fieldied robots. I connect fleet signals, customer support, non-reported error codes, production, quality, purchasing, software issue flow, Jira, ERP/Odoo, training, and leadership review into clearer triage, acceptance, release-readiness, and learning mechanisms. The practical discipline is consistent: make the signal visible, identify the decision, clarify ownership, and return evidence to the product.

I also bring direct food and grocery launch experience from Amazon. I served on the Prime Now launch team with Whole Foods, earned a Food Safety Management certification while at Amazon, and led Prime Pittsburgh execution in a 24/7 customer-backward environment supporting approximately five million second-day orders annually. That work taught me that a food-related customer promise depends on more than speed: quality, safety awareness, staffing, flow, escalation, standard work, and recovery must operate as one system.

Earlier, at Compunetics, I led engineering, manufacturing, quality, validation, documentation, and customer delivery in high-reliability electronics. Together, these experiences give me an unusual transferability profile for Lab37: fieldied robotics, food fulfillment and safety literacy, electromechanical manufacturing, and product decision systems.

For our conversation, I created an independent candidate vision at russelldudek.github.io/Lab37/. It demonstrates how I would approach the role through an Order-to-Outcome Trace, the Bowl Builder Product Contract, a pilot evidence model, and a 90-day entry plan. These are hypotheses for discovery—not claims about undisclosed Lab37 processes—and are intended to make my reasoning concrete.

My thesis is simple: every release should make Bowl Builder easier to trust, easier to operate, and easier to scale. I would welcome the opportunity to discuss where the team most needs product clarity now—roadmap trade-offs, recipe and food-control acceptance, pilot evidence, KPI visibility, release readiness, or the path from field signal to reusable product decision.

Carpe diem,

Russell Dudek

PRODUCT CONTRACT One release decision across food, machine, software, operator flow, service, and economics.	PILOT EVIDENCE A deployment closes with a roadmap, release, operating, or next-experiment decision.	FIRST 90 DAYS Read the system, prove one complete decision loop, and make learning repeatable.
