

FIRST 90 DAYS

READ THE SYSTEM | PROVE THE CONTRACT | MAKE LEARNING REPEATABLE

90-DAY OUTCOMES

- ? One shared system map of dependencies, decisions, trusted signals, and evidence gaps.
- ? One pilot or release carried through requirement, acceptance, launch readiness, field evidence, and roadmap action.
- ? A useful product review cadence connecting roadmap, release, pilots, telemetry, exceptions, customer insight, and economics.
- ? A pilot-to-release record and onboarding blueprint that make the next site or recipe easier than the last.

GUIDING PRINCIPLES

- ? Observe before prescribing.
- ? Use artifacts to clarify decisions, not create documentation volume.
- ? Treat exceptions as product data.
- ? Give every KPI units, context, source, and decision use.
- ? Return every pilot and release learning to the product.

LISTENING MAP

Mechanical, electrical, software, data, culinary, manufacturing, quality, support, field, customer, commercial, and leadership stakeholders.

DAYS 1-60

READ THE SYSTEM AND PROVE ONE COMPLETE PRODUCT CONTRACT

DAYS 1-30 | READ THE SYSTEM

- ? Observe lab testing, assembly, recipe setup, loading, production, cleaning, maintenance, support, and customer use.
- ? Map recurring roadmap, release, pilot, escalation, and post-launch decisions and clarify who recommends, decides, operates, and escalates.
- ? Inventory trusted metrics, telemetry, manual records, bowl-level data, support context, quality data, business outcomes, and interpretation limits.
- ? Select one decision-critical pilot or release with enough access and evidence to learn within 30 days.

DAYS 31-60 | PROVE THE CONTRACT

- ? Author or refine the PRD, user stories, acceptance criteria, assumptions, dependencies, decision owner, and success measures.
- ? Combine operator interviews, workflow observation, technical input, telemetry, support cases, and business context.
- ? Facilitate one integrated readiness review across food, machine, software, operator, manufacturing, support, and commercial conditions.
- ? Define pilot baseline, site context, onboarding, test plan, exceptions, data capture, customer interface, and decision close.

DAYS 61-90

MAKE PRODUCT LEARNING REPEATABLE WITHOUT UNNECESSARY CEREMONY

REUSABLE MECHANISMS

- ? Roadmap decision record: outcome, dependency, acceptance, economics, ownership, and learning value.
- ? Product health view: system performance and business outcomes with context and exceptions.
- ? Pilot evidence review: baseline, operating context, evidence, exceptions, customer voice, decision, owner, and follow-up.
- ? Release readiness: only conditions that materially change confidence, recovery, customer outcome, or cost.
- ? Field-to-requirement loop: signal, context, root cause, product decision, owner, and validation result.
- ? Onboarding blueprint: site readiness, integration, install, recipe setup, training, go-live, support, and first review.

BALANCED PRODUCT SCORECARD

System, food, operator, customer, economics, and learning-speed categories. Measures are proposed for discovery, not claims about current Lab37 dashboards or thresholds.

DAY-90 SUCCESS

The goal is not more product documents. It is a clearer operating system for decisions: the team can see what the complete product must do, which evidence matters, who owns the trade-off, what a pilot learned, and how that learning changes the next release or deployment.
