

TURN EVERY BOWL INTO A PRODUCT DECISION

INTERVIEW THESIS BRIEF | 1 OF 4

THE ACTUAL MANDATE

Make a promising robotic makeline repeatable across recipes, sites, operators, support models, and economics by keeping food behavior, electromechanical performance, order truth, operator flow, serviceability, and commercial evidence inside one product decision system.

CENTRAL OPERATING TENSIONS

- ? Speed versus integrated readiness.
- ? Modularity versus system coherence.
- ? Customer specificity versus reusable product learning.
- ? Throughput versus recoverability.
- ? Technical proof versus business proof.

CANDIDATE THESIS

Every release should make Bowl Builder easier to trust, easier to operate, and easier to scale.

THE BOWL BUILDER PRODUCT CONTRACT

INTERVIEW THESIS BRIEF | 2 OF 4

FIVE CONTRACTS

- ? Recipe behavior: acceptable ingredient, environment, portion, and modification ranges.
- ? Machine performance: capacity, accuracy, uptime, access, fault behavior, and recovery.
- ? Order truth: POS input, recipe configuration, bowl records, camera evidence, fleet signals, and version state.
- ? Operator flow: loading, replenishment, changeover, intervention, cleaning, training, and escalation.
- ? Scale economics: labor, waste, support, installation, reliability, utilization, and customer evidence.

DECISION RECORD

- ? Outcome and customer promise.
- ? Acceptance conditions across affected contracts.
- ? Evidence, units, baseline, context, and exceptions.
- ? Authority: who recommends, decides, operates, validates, and escalates.
- ? Economics and learning close.

EVIDENCE MAP

INTERVIEW THESIS BRIEF | 3 OF 4

VAPE-JET

Approximately 1,000 fielded robots; telemetry, machine-vision context, support, engineering issue flow, quality, production, ERP, training, and release readiness.

AMAZON

Prime Pittsburgh launch, 24/7 execution, customer promise, high-volume flow, staffing, metrics, escalation, and standard work.

COMPUNETICS

Electromechanical engineering, manufacturing, quality, validation, documentation, lifecycle controls, complex assemblies, and high-reliability customer delivery.

DUDEWORTH

PRDs, stories, acceptance criteria, AI-assisted workflows, human authority, review gates, decision records, evaluation, and governance.

INTERVIEW WORKING PAGE

INTERVIEW THESIS BRIEF | 4 OF 4

FIRST 90 DAYS

- ? Days 1-30: observe the system, map decisions, evidence, ownership, and trusted measures.
- ? Days 31-60: carry one pilot or release through requirements, readiness, validation, evidence, and decision close.
- ? Days 61-90: install the smallest useful roadmap record, product-health view, pilot review, and field-to-requirement loop.

EXECUTIVE QUESTIONS

- ? Which decision is hardest because evidence lives across food, hardware, software, field operations, and economics?
- ? What must a pilot prove before the learning becomes reusable?
- ? Which performance signals are trusted today, and where is context still manual?
- ? How are culinary requirements, machine acceptance, and customer outcomes reconciled under time pressure?
- ? What would make this PM indispensable twelve months from now?

CLOSING POSITION

My product-management value is making complex work visible enough to decide. I connect customer and field truth to the requirements, evidence, ownership, launch discipline, and operating cadence that let multidisciplinary teams move faster together.
